D206 Data Cleaning Performance Assessment

Ednalyn C. De Dios

For this performance assessment, I have chosen to use the Telco churn data set.

Part I. Research Question

A. Question or Decision

Are customers who had not set up an automatic payment method more likely to churn than those customers who had set up an automatic payment method?

For this question, I will attempt to address it by looking at the "PaymentMethod" variable and making a new column that designates whether the payment method is automatic or not. I will call this variable "IsPaymentAutomatic." For example, if a record's "PaymentMethod" is electronic check, bank (automatic bank transfer), or credit card (automatic), I will classify the "IsPaymentAutomatic" as 1. Otherwise, 0 for everything else.

What factors contribute to customer churn?

This second research question needs to be answered by using and considering all variables in the data set. I can extract feature importance by using xgboost or random forest, for example.

```
In [1]: # setting the random seed for reproducibility
import random
random.seed(493)

import pandas as pd # for manipulating dataframes
import numpy as np # for numerical operations
import matplotlib.pyplot as plt # for visualization
from sklearn.impute import SimpleImputer # for handling missing values

# to print out all the outputs
from IPython.core.interactiveshell import InteractiveShell
InteractiveShell.ast_node_interactivity = "all"

# set display options
pd.set_option('display.max_columns', None)
pd.set_option('display.max_rows', None)
pd.set_option('display.max_colwidth', None)
```

```
In [2]: # Read a csv file
df = pd.read_csv('churn_raw_data.csv', index_col=0)
```

In [3]: # Preview the data
 df.head(5)
 df.tail(5)

df.shape

B. Required variables

| Variable | Data Type | Description | Example | ------ | ------ | ------ | ----- | ------ | CaseOrder | Integer | Designates the original order of the raw data file | 1-10000 | Customer id | String | Unique identifier for customers | K409198, S120509, K191035 | Interaction | String | Unique identifiers related to customer transactions, technical support, and sign-ups | aa90260b-4141-4a24-8e36-b04ce1f4f77b | City | String | Customer's city of residence | Mobeetie | **State** | String | Customer's state of residence | TX | County | String | Customer's county of residence | Wheeler | Zip | Integer* | Customer's ZIP code of residence | 79061, 30117, 30523 | Lat | Float | GPS coordinates for lattitude of customer's residence | 34.70783 | Lng | Float | GPS coordinates for longitude of customer's residence | 83.53648 | **Population** | Integer | Population within a mile radius of customer's residence based on census data | Area | String | Type of area for customner's residence | Rural, Urban, Suburban | **TimeZone** | String | Time zone of customer's residence | America/Chicago | Job | String | Job title of the customer | IT technical support officer | Children | Float* | Number of children in the customer's household | 3.0, 4.0, 1.0 | Age | Float* | Customner's age | 48.0, 39.0, 28.0 | **Education** | String | Highest degree completed by cusstomer | Regular High School Diploma | **Income** | Float | Customer's annual income | 55723.74, 16667.58, 28561.99 | Marital | String | Customer's marital status | Married,

Divorced, Never Married, Separated | Gender | String | Customer's gender | Female, Male, Prefer not to answer | **Churn** | String | Whether the customer discontinued service within the last month | Yes, No | Outage sec perweek | Float | Average number of seconds per week of system outages in customer's neighborhood | Email | Integer | Number of emails sent to the customer in the last year | 12, 9, 15 | **Contacts** | Integer | Number of times the customer contacted technical support | 2, 1 | Yearly equip failure | Integer | Number of times the customer's equipment failed and had top be reset or replaced in the past year | 0, 1 | **Techie** | String | Whether the customer thinks themselves as technically inclined | Yes, No | Contract| String | The contract term for the customer | Month-to-month, Two Year | Port modem | String | Whether the customer has a portable modem | Yes, No | **Tablet** | String | Whether the customer owns a tablet | Yes, No | **InternetService** | String | The customer's type of internet service | DSL, Fiber Optic | Phone | String | Whether the customer has a phone service | Yes, No | Multiple | String | Whether the customer has multiple phone lines | Yes, No | OnlineSecurity | String | Whether the customer has an online security add-on | Yes, No | OnlineBackup | String | Whether the customer has an online backup add-on | Yes, No | **DeviceProtection** | String | Whether the customer has device protection add-on | Yes, No | **TechSupport** | String | Whether the customer has technical support add-on | Yes, No | **StreamingTV** | String | Whether the customer has streaming TV | Yes, No | **StreamingMovies** | String | Whether the customer has streaming movies | Yes, No | PaperlessBilling | String | Whether the customer has enrolled in paperless billing | Yes, No | PaymentMethod | String | Customer's method of payment | Electronic Check, Bank Transfer(automatic) | Tenure | Float | Number of months the customer has stayed with the provider | 68.19713, 61.04037, 71.09560 | **MonthlyCharge** | Float | Amount charged to the customer monthly | 159.8288, 168.2209, 218.3710 | **Bandwidth GB Year** | Float | Average amount of data used by the customer in GB within a year | 6511.253, 5857.586, 4159.306 | **Item1** | Integer | Rate of the importance of timely response as rated by the customer with 1 being the most important and 8 being the least important | 1-8 | Item2 | Integer | Rate of the importance of timely fixes as rated by the customer with 1 being the most important and 8 being the least important | 1-8 | Item3 | Integer | Rate of the importance of timely replacements as rated by the customer with 1 being the most important and 8 being the least important | 1-8 | Item4 | Integer | Rate of the importance of reliabilitye as rated by the customer with 1 being the most important and 8 being the least important | 1-8 | Item5 | Integer | Rate of the importance of optionse as rated by the customer with 1 being the most important and 8 being the least important | 1-8 | Item6 | Integer | Rate of the importance of respectful responsee as rated by the customer with 1 being the most important and 8 being the least important | 1-8 | Item7 | Integer | Rate of the importance of courteous exchange as rated by the customer with 1 being the most important and 8 being the least important | 1-8 | Item8 | Integer | Rate of the importance of evidence of active listening as rated by the customer with 1 being the most important and 8 being the least important | 1-8

^{*} Wrong data type, needs to be transformed (typecasted)

Part II. Data Cleaning Plan

C1. Plan to Assess the Quality of Data

Look for duplicates

The duplicated() method will be used to find out if any duplicated rows exist in the data set. Then, the .shape attribute will be utilized to determine how many rows (if any) are duplicated.

• Find missing values

df.isnull().sum() will be used to count the number of true NaNs in the dataset for each column. ((df == 'nan') | (df == 'NaN')).sum() will also be used to catch any literal "nan" or "NaN" values in the dataset for each column. The results will be presented in tabular format for readability.

Examine data types for correctness

I will use the .info() method to take note of the data types for each feature in the data set. Then, I will examine each one and use domain knowledge to verify if they are assigned the correct data type or not.

Check for outliers

I will utilize a function to loop through each outliers. The function will use boxplots to visually examine the outliers and print outs of values outside the upper and lower bound to identify those outliers.

C2. Justification of Approach to Assess the Quality of Data

The first step in my approach to assess the quality of the data is to look for duplicates. This is an important step because ignoring duplicates can skew the distribution of the data set and would result in incorrect visualizations like histograms.

The second step is to find missing values in the data set. This is a crucial step because missing data introduces bias into models. Missing data in the data set can also reduce the statistical power of analysis conducted on the data set.

The third step is to examine the data types for correctness. Doing so shall avoid errors stemming from incorrect data types and mismatched values.

The last step is to check for any outliers. This is necessary if the aforementioned outliers cause unnecessary skewness in the data distribution.

C3. Justification of Tools Used to Assess the Quality of Data

I will use Python to assess the quality of the data set. Using a few libraries and packages such as pandas and matplotlib will allow me to examine and review the untidiness in the data. For example, pandas has an isnull() function that can be used to filter rows in the dataframe that has null values. Moreover, visualization packages like matplotlib allow me to eyeball any outliers in the data and give me a ballpark value to input so that I can filter and remove those outliers.

C4. Annotated Code Used to Assess the Quality of Data

- Look for duplicates
- Find missing values
- Examine data types for correctness
- Check for outliers

Look for duplicates

```
In [4]: # Select rows that are duplicated based on all columns. Any records after the first
dup = df[df.duplicated()]

# Find out how many rows are duplicated
dup.shape
Out[4]: (0, 51)
```

Find missing values

```
In [5]:

def show_missing(df):
    """

    Takes a dataframe and returns a dataframe with stats
    on missing and null values with their percentages.
    """

    null_count = df.isnull().sum()
    null_percentage = (null_count / df.shape[0]) * 100
    empty_count = pd.Series(((df == ' ') | (df == '')).sum())
    empty_percentage = (empty_count / df.shape[0]) * 100
    nan_count = pd.Series(((df == 'nan') | (df == 'NaN')).sum())
    nan_percentage = (nan_count / df.shape[0]) * 100
    dfx = pd.DataFrame({'num_missing': null_count, 'missing_percentage': empty_percen' num_empty': empty_count, 'empty_percentage': empty_percen' nan_count': nan_count, 'nan_percentage': nan_percentage})
    return dfx

show_missing(df)
```

Part III. Data Cleaning

Cleaning Steps:

- 1. Handle missing numerical values by using mean imputation
- 2. Correct data types
- 3. Remove outliers
- 4. Handle missing categorical values by assigning their respective modes

In [9]: dfx = df.copy()dfx.head() In [10]: Out[10]: CaseOrder Customer_id City State Interaction County Zip Lat aa90260b-Prince of 4141-4a24-Point 1 1 K409198 ΑK Wales-99927 56.25100 -133 Baker 8e36-Hyder b04ce1f4f77b fb76459fc047-4a9d-West 2 2 S120509 MI Ogemaw 48661 44.32893 -84 8af9-Branch e0f7d4ac2524 344d114c-3736-4be5-3 3 K191035 Yamhill OR Yamhill 97148 45.35589 -123 98f7c72c281e2d35 abfa2b40-2d43-4994-San 4 4 D90850 CA 92014 32.96687 -117 Del Mar Diego b15a-989b8c79e311 68a861fd-0d20-4e51-Fort 5 5 K662701 Needville TX 77461 29.38012 -9; Bend a587-8a90407ee574

D1. Cleaning Findings

- 1. Data set has no duplicates.
- 2. Data set has missing values both numerical and categorical.
- 3. A few columns had incorrect data types.
- 4. Outliers exist in several columns but only "MonthlyCharge" makes sense to remove.

D2. Justification of Mitigation Efforts

- 1. The data set has no duplicates so no duplicates were removed.
- 2. The data set has several columns with missing data or nulls and NaNs. For the numerical values, the missing values were imputed by mean. For the categorical, the missing values were assigned their respective modes.
- 3. Incorrect data types had to be dealt with manually by casting the column values to their correct data type. "Zip" was cast as a string. "Children" and "Age" were cast as integers.
- 4. While the data set has several columns with outliers, I have decided to only remove the outliers in "MonthlyCharge" because it is the only column that retains its truest form when the outliers were removed. Removing the outliers in other columns would skew data distribution.

D3. Summary of the Outcomes

- 1. The dataframe was unchanged.
- 2. The dataframe retained its shape.
- 3. The dataframe retained its shape.
- 4. The dataframe decreased by five in the number of rows. The number of columns remained the same.

In the end, there were 9,995 rows and 51 columns.

D4. Mitigation Code (Executable File)

Filename: clean_churn.py #!/usr/bin/env python """ WGU D206 Data Cleaning Performance Assessment """ import sys # setting the random seed for reproducibility import random random.seed(493) import pandas as pd # for manipulating dataframes import numpy as np # for numerical operations import matplotlib.pyplot as plt # for visualization from sklearn.impute import SimpleImputer # for handling missing values def impute_mean(df, column): Takes a dataframe and column name and returns a dataframe with imputed values mean_imputer = SimpleImputer(strategy='mean') df[column] = mean_imputer.fit_transform(df[column].values.reshape(-1,1)) return df def main(): """Main entry point for the script.""" # Read a csv file df = pd.read_csv('churn_raw_data.csv', index_col=0) dfx = df.copy()# assemble list of column names that have missing values (numerical) missing_columns_num = ['Children', 'Age',

    __status__ = "Prototype"data.csv', index=False)

if __name__ == '__main__':
    sys.exit(main())
```

D5. Clean Data

Filename: churn_cleaned_data_notebook.csv

D6. Limitations

During the data cleaning step of handling missing values, the categorical columns had a significant number of missing values. If the rows that have this missing values were to be dropped, the shape of the dataframe would change dramatically from 10,000 to 4,781 records. Hence, the missing values of the categorical type were filled with the respective mode instead.

This presents a minor limitation in future analysis if these categorical variables were to be examined.

D7. Impact of Limitations

However, since the current research question mainly dealt with only "Churn" and "PaymentMethod," the current mitigation step to handle the missing categorical values was of no consequence to the current research question.

E2. Criteria Used

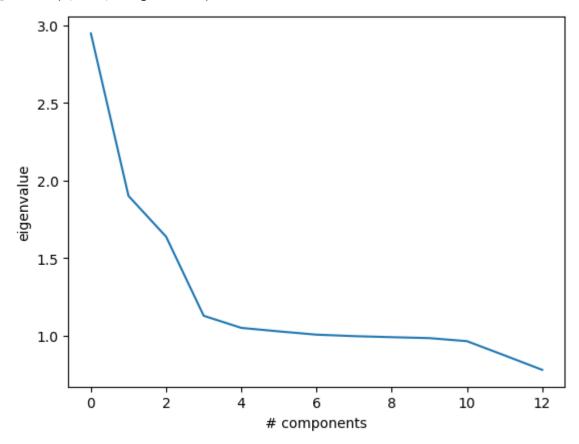

After normalizing and selecting numeric features, I applied Scikit Learn's PCA and chose to keep about 85% of the variance in the original data. This resulted in the selection of 13 components.

```
In [42]: # plot eigenvalues
    plt.plot(eigenvalues)
    plt.xlabel('# components')
    plt.ylabel('eigenvalue')
    plt.show()

Out[42]: [<matplotlib.lines.Line2D at 0x1c484419580>]

Out[42]: Text(0.5, 0, '# components')
```

Out[42]: Text(0, 0.5, 'eigenvalue')

E3. Benefits

The table of component values suggests that MonthlyCharge and Outage_sec_perweek are important features. The organization would benefit from this information by mitigating outages and curbing fees.
